Positive indicators for West Nile Virus reported in Colton and Upland

The Division of Environmental Health Service’s Mosquito and Vector Control Program (MVCP) has reported multiple positive indicators for West Nile Virus (WNV) in San Bernardino County. MVCP has sentinel chicken flocks placed in various locations throughout San Bernardino County to detect WNV. If any sentinel chickens test positive for WNV, it means that the mosquito population in these areas are infected, increasing the possible risk of the public being infected. Chickens are not harmed by the virus.

Two chickens from a sentinel flock in Colton were reported to have tested positive for WNV. In addition, a group of mosquitoes collected for testing in Upland and Colton were reported to have tested positive for the virus. MVCP is taking steps to eliminate mosquito breeding hazards.

Those infected with West Nile fever may experience flu-like symptoms that can include fever, body aches, skin rash, and fatigue. In some individuals, West Nile fever can develop into a more serious form of the disease. If you have been bitten by mosquitoes and are experiencing these symptoms, contact your medical care provider.

Residents can protect themselves from WNV by following these tips:

- **Drain or Dump** – Remove all standing water around your property where mosquitoes can lay eggs such as bird baths, green swimming pools, ponds, old tires, buckets, flower pots, clogged gutters, or even puddles from leaky sprinklers.
- **Dawn and Dusk** – Avoid spending time outside when mosquitoes are most active.
- **Dress** – Wear shoes, socks, and long pants and long-sleeved shirts that are loose fitting and light colored.
- **DEET** – Apply insect repellent containing DEET according to manufacturer’s directions.
- **Doors** – Make sure doors and windows have tight-fitting screens. Repair or replace screens that have tears or holes to prevent mosquitoes from entering your home.
